

Ghost v1.0.0.0 Update Procedure

With Ghost v1.0.0.0 all compatibility is broken (intentionally) with previous pre-release builds.

This allowed us to make some badly required changes to ensure that we don't need to break compatibility in the future.

Step 1: Update ALL receivers

1. Use the Ghost Updater to update the JR module using the **v1.0.0.0 Rx Only** image.
DO NOT use the **v1.0.0.0** version which includes both Tx and Rx.
2. Bind to, and update ALL receivers in your possession. Once the Tx is updated, you will not be able to update them without first downgrading the Tx.

Step 2: Update JR module

1. Run the Ghost Installer and update to **v1.0.0.0**
2. Bind as normal to the already-updated receivers.

NOTE: The updater in pre-v1.0.0.0 firmware had some random ‘unwanted’ behavior. To avoid it, switch the OpenTx protocol to something that the JR module doesn’t support (such as PPM).

With v1.0.0.0 a lot of effort was put into updater robustness, and this is no longer required.
